

Business Resilience

Business Resiliency Built for Digital Transformation

Scale Computing has built its business on the principles of resiliency and end-to-end data protection. The Business Resiliency System (BRS) takes this to another level by giving organizations everything they need to avoid downtime, lost revenue, and fallout from cyber attacks. By delivering full data protection, the BRS along with Acronis Cyber Backup 15 Advanced allows IT administrators to rest assured that their systems will stay up and running.

Benefits

Active ransomware protection, granular-file level backups, long-term archiving, and instant recoveries are central to the Business Resiliency System. Plus, IT Administrators can capture these benefits without the need to install “in-guest” backup agents. With the BRS, customers can virtually eliminate downtime thus improving business outcomes and confidence.

Ease of Management

Comprehensive data protection strategies can be hard to implement and even harder to maintain. The Business Resiliency System utilizes Scale Computing’s award-winning interface, thus eliminating confusion and time consuming management tasks. IT administrators can now build out robust business continuity strategies without pulling too much time away from their other critical responsibilities.
